## Abstract

The objective is to carry out an analysis of OBSS with the intention of determining the criteria and features that will be used in a OBSS solution

Using empirical propagation formula, the number of overlapping networks is estimated for various residential scenarios.
A Channel Selection search simulation program is then used to estimate the overlapping probabilities for each scenario.

The results are then analyzed.

## Propagation Formula

Indoor propagation loss formula (11n) *,
For d<16.5ft
$L p=-38+20 \log F+20 \log d+$ Wall/Floor loss
For $d>16.5 f t$
$L p=-38+20 \log F+20 \log 16.5+35 \log (d / 16.5)+$ Wall/Floor Loss
Std. Dev 3-4dB (Shadow Loss)
*Erceg et al (2004) as per 11n, Channel Model B - Residential

- 10dB Outer Wall loss has been used in calculations
- No internal wall or floor losses used in calculations

NOTE: "Indoor Propagation Empirical Formula with Testing in a typical Californian Home", Graham Smith 2004
For $d<35 f t$
$L p=-38+20 \log F+20 \log d+$ Wall/Floor loss For $d>35 f t$
Lp $=-69+20 \log F+40 \log d+$ Wall/Floor Loss

Slide 3

## Terraced/Town Houses

Neighbors 3 houses down, and opposite houses within 150 feet have potential to overlap
Note: No internal wall losses, external wall loss only.

## Detached Houses

Neighbors 1 house down, and opposite houses within 150 feet have potential to overlap

## Detached Houses

## Town Houses - Dense

25 Potential APs in range

## Terraced Houses

Leigh Park, Havant, England

\author{

- 150 ft .
}

16 Potential
APs in range

## Apartment Block Single Layout

Total within range $=28$

Each Apartment $20 \times 35$ feet about 700 square feet

## Apartment Block - Double Layout

Apartments across the corridor

Total within range $=28+25=53$

## Summary

- Examples used show maximum potential number of APs within range
- Detached Houses12
- Terraced Houses 16
- Townhouses25
- Single Layout Apartments 28
- Double Layer Apartments 53
- Number of Channels
- 2.4 GHz 20 MHz

3

- $5 \mathrm{GHz} \quad 20 \mathrm{MHz}$

40 MHz
24 USA, 19 Europe
11 USA, 9 Europe

## Minimum number of Channels Apartments single layout

In fact, if one applied standard channel re-use to the Apartment single layout, 28 overlapping APs, only 8 channels are actually required.

## Channel Selection Analysis Program

- A program has been written in order to analyze what happens when each AP uses a Channel Selection scheme.
- The objectives are:
- Determine how many channels are required to 'guarantee' zero or one overlaps
- Investigate the overlap situation and "AP chains"
- Use results to determine requirements for the OBSS solution

## AP Channel Selection Analysis Program

## Set-Up

- Set up an Apartment block or block of houses, e.g.:
- Number of Apartments per floor
- Number of floors
- Select number of Channels (24 max)
- Select percentage of Apartments/Houses to be assigned
- Select number of times to run through the program
- So as to obtain a reasonable variation (e.g. run 100 times and gather the results

Program outline

- Randomly select an Apartment/House
- Scan the surrounding apartments/houses in range
- First select channel(s) with least other APs
- If more than one, then select channel with least total overlaps
- E.g. Channel 1:2 other APs, 1 overlap (one AP already sharing)
- Channel 2: 2 other APs, 0 overlaps.
- Selection will pick Channel 2
- Update each apartment/house with the number of other APs with which it is sharing

## Program Inputs used for Reported Results

- Number of Channels
- 24, 22, 19, 17, 11, 9
- Representing maximum 20MHz for USA and Europe: 24 and 19
- Say 2 channels lost to radar: 22 and 17
- 40MHz channels: 11 and 9
- Scenarios
- Detached House 12 others in range
- Terraced Houses 16 others in range
- Town Houses 24 others in range
- Apartment single block 28 others in range
- Apartment Double Block 53 others in range
- Number of apartments/houses
- Apartment blocks $10 \times 10$ (x 2) 100 for single, 200 for double
- Houses Block of 100 Houses
- Percentage Apartments/houses assigned 10\% to 100\%

## Program Outputs

Over the total number of times the program is run (usually 100)

- The Total number of apartments/houses assigned channels
- Optional print out of Assigned Channel and Overlapping Matrices
- The number of apartments/houses that are sharing, as a fraction,
- Zero others
- Zero or just one other
- Two others
- Three or more others

Possibility of a ‘hidden’ AP
Definite AP Chain situation

## Detached Houses - 12 overlaps

| Channels | Possibility Zero overlap |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \% Houses Assigned Channels |  |  |  |  |  |  |  |  |  |
|  | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |
| 24 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 |

Before we analyze these results, I want to divert to look at what
2 or 3+ overlaps indicates

1 overlap is clearly the basic OBSS.
Two APs hear each other and can communicate

Next slides are examples of outputs where deliberately low number of channels chosen to force 2 and 3 overlaps

Feb 2009
Single Apartment Block, 28 overlap
Enter the apartments per floor:10
Enter the number of floors:10
Enter max number of channels:8 (Note: to force overlaps)
Percentage of Apartments to be assigned:100
Enter number of superLoops:1

Total Apartments Assigned: 100
Probability of no overlaps: 0.38
Probability of one overlap: 0.44
Probability of zero or one overlap: 0.82
Probability of two overlap: 0.18
Probability of three plus overlaps: 0.0

# HIDDEN AP 

## Assume APs advertise their overlaps

Each AP sees 2:2:2
Knows they are sharing with two others, who also share with 2 others In this particular case, all APs see each other and no hidden APs BUT ...See Next Slide

## 2:2:2 Situations - Hidden APs?

## 3 Overlaps

Single Apartment Block, 28 overlap
$10 \times 10$
Max number of channels:7 to force bad overlap

## Identifying Hidden APs

Assuming QAPs advertise their overlaps

- We see following overlap situations; QAP A:QAP B: QAP C
- 3:1:1:1 QAP A sees three other QAPs, but knows that they
- 0
- $1: 1$
- 1:2
- 2:1:1
- 2:2:1
- 2:2:2
- *3*

No sharing
QAP A sees QAP B who sees only QAP A
QAP A knows that QAP B sees an AP that is hidden from QAP A
QAP A sees two APs who do not see each other
QAP A knows that QAP B sees an AP that is hidden from QAP A
Could be that all three QAPs see each other but not sure do not see each other Any other combination with a 3 implies hidden APs

Can we use this in any meaningful way?

## Results for Channel Search

- Number of available channels is really important
- Double apartment block with 53 APs in range
- 17 Channels, $99.3 \%$ possibility of zero or 1 overlap - GOOD
- 11 Channels, $59.3 \%$ possibility of zero or 1 overlap - NOT GOOD
- Single Apartment Block, 28 APs in range
- 11 Channels, $98.6 \%$ possibility of zero or 1 overlap - OK?
- 9 Channels, $91.5 \%$ possibility of zero or 1 overlap - NOT TOO BAD?
- Town Houses, 24 APs in range
- 11 Channels, $99.4 \%$ possibility of zero or 1 overlap - GOOD
- 9 Channels, $99.1 \%$ possibility of zero or 1 overlap - GOOD
- Terrace Houses, 16 APs in range
- 9 Channels, $99.8 \%$ possibility of zero or 1 overlap - GOOD
- Detached Houses, 12 APs in range
- 9 Channels, $100 \%$ possibility of zero or 1 overlap - GOOD

## Channels Conclusions - 40/20MHz Channels

Use of 11 and 9 Channels

- For "House" scenarios, 40MHz channels should be able to operate OK.
- For "Apartment" Scenarios, 40MHz channels can cause concern

CONCLUSION

- 40MHZ channels should drop back to 20 MHz when the overlapping situation becomes excessive.
- We need a workable method for 11n APs to decide when keeping to 40 MHz channel is not the right thing to do (for their own sake as well as others)

## 20/40MHz Operation

## 20/40 BSS Operation*

Co-Existence with neighboring BSSs is managed through a number of mechanisms, including:

- Overlapping BSS scanning and careful channel selection on initial BSS setup to avoid channels already in use by other BSSs.
- Changing channels or operating width after BSS setup if a new BSS is detected operating on the secondary channel
Also
- 40 MHz Intolerance bit can be set by any STA, (7.3.2.61) but only for 2.4 GHz
- 20/40 Intolerant Channel Report Element (7.3.2.59)
- Overlapping BSS Scan Parameters element (7.3.2.60)

In high OBSS conditions, networks should fall back to 20 MHz operation NEED TO MAKE SOME RULES??

* Reference: "Next Generation Wireless LANS: Throughput, Robustness and Reliability in 802.11n", Eldad Perahia and Robert Stacey, Cambridge University Press 2008.

## Channel Search Conclusions - Overlap Indication

- Channel Search algorithm is slightly better if the overlaps are used
- QAPs could indicate their overlap situation
- QAPs know if "hidden" QAPs are on same channel, if they know the overlap figures

Conclusion: Worthwhile that a QAP indicates its overlap situation

## Summary

- 5 GHz operation is necessary
- Channel Selection is required
- With Channel Selection, overlap with zero or just one other is a very common occurrence
- QAPs should indicate their overlap information:
- The Channel Selection is better
- QAPs 'know' if there is a hidden QAP
- 40 MHz channels is fine for many scenarios
- Need to ensure 40 MHz channels drop back to 20 MHz when the overlap is excessive

These Points are now to be used in the OBSS Proposal "OSQAP"
