**Re:** Proposal and Discussion of equal higher data rates for PHY for 900 and 2400MHz bands

**Abstract:** The proposed parallel reuse of the 2.4 GHz 802.15.4 modulation technology in PSSS offers highly attractive performance improvement, fulfilling all key OEm requirements, and visibly increasing market opportunities.

**Purpose:** Proposal for consideration by TG4b

**Notice:** This document has been prepared to assist the IEEE P802.15. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

**Release:** The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by P802.15.

# PSSS Proposal Parallel reuse of 2.4 GHz PHY for the sub-1-GHz bands

> Hans van Leeuwen (hvl@sts.nl) STS

### **Presentation Contents**

- Introduction
  - Changes vs. PSSS presentation at March 2003 meeting (Orlando)
  - Motivation and requirements for TG4b PHY
  - New Specifications for Low Bands
- PHY Performance
- PHY Technology
  - O-QPSK / I/Q and BPSK/ASK
- PHY Implementation aspects
  - Selected Rx implementation options
  - Crystal quality frequency offset tolerance
  - Linearity
  - Chip size and power consumption
- Status
- PAR compliance
- Summary

# Changes vs. PSSS presentation at March 2004 meeting (Orlando)

- Unchanged proposal for parallel reuse of 2.4 GHz PHY!
  - Added option of use of BPSK/ASK instead of O-QPSK
    - Based on OEM and semiconductor manufacturers requirements
    - To avoid added complexity and cost for two radio cores
    - To avoid doubling required bandwidth for O-QPSK
  - Added option to reduce 868 Mhz bandwidth to 500 Khz
    - Reduce implementation complexity and cost
    - Achieve still 234 kbit/s
  - Details of combining provided that were not shown in March 2004
    - Coding gain through simple precoding in combiner
- Added new results on PSSS
  - Solution performance
  - Implementation aspects
  - Status

#### Why do we want higher data rate

- Visibly over 200 kbit/s required especially in Europe (i.e. CEPT countries) due to 1% Tx duty cycle limit
  - Prohibits many application from using 868 MHz PHY today
  - Visibly 200 kbit/s would effectively turn limitation for devices into protection against interference from other applications
- Power consumption reduction (if done well)
- Reduced delay for packets
- Better performance and increased scalability for mesh networks
  - Removes today's functional limitations of 868/915 MHz meshs
- Marketing

### What is important for the technical selection ?

- Data rate visibly higher then 200 kbit/s in existing 868 MHz regulation
- Visibly better multipath fading robustness
- Backward compatible to 868/915 MHz PHY must in IEEE802
- Small implementation, *low* cost but not *lowest* cost

## We believe it is key to listen to OEM requirements

## New Specifications for the Low Bands

- We can expect new frequency bands specifications for the sub-1-GHz ISM bands (868, 915 MHz) in Europe and Asia with increased RF bandwidth
- However, it will take years until the changed SRD band specifications are implemented by all relevant CEPT countries
- Therefore 3 forms of *derivative modulations yielding higher data rates*<sup>1</sup> are desirable:
  - Higher rate in 915 MHz band
  - Higher rate in existing European band
  - Higher rate in new, upcoming European 863-870 MHz band

<sup>1:</sup> Scope as defined in PAR

## System characteristics

	IEEE 802.15.4-2003 868 / 915 MHz PHY	<b>PSSS proposal –</b> (March 2004: 8x parallel 2.4 GHz PHY in 868 / 915 MHz)	"Halfrate" proposal
Bandwidth	600 / 2000 Khz	600 (600) / 2000 (2000) kHz	2000 Khz
Chiprate	300 / 600 kcps	300 (500) <sup>1+2</sup> / 1000 (2000) <sup>2</sup> kcps	1000 kcps
Bitrate	20 / 40 kbit/s	300 (234) <sup>1+2</sup> / 1000 (938) <sup>2</sup> kbit/s	125 kbit/s
Spectral efficiency	1/15 bit/s/Hz	1/2 (15/32) bit/s/Hz	1/16 bit/s/Hz
Spreading	15 chip sequence	32 chip sequence	32 chip sequence
Channelization	1 / 10 channels	unchanged, 1 / 10 channels	unchanged, 1 / 10 channels
RF backward compatibility	BPSK	(Single BPSK/ASK radio) BPSK + O-QPSK / I/Q	Requires <i>duplicate</i> Rx + Tx cores for BPSK <i>and</i> O- QPSK
Synchronization, clock recovery	BPSK	(Single BPSK/ASK radio) BPSK + O-QPSK / I/Q	Required <i>twice</i> for BPSK <i>and</i> O-QPSK

"(...)" Proposed options of PSSS proposal – Changes are 1: Reduce EU signal bandwidth, 2: Use BPSK/ASK

## System performance

	PSSS proposal	"Halfrate" proposal
Coding gain (vs. coherent BPSK, at 10 <sup>-5</sup> BER)	≈ 13 dB	≈ 1 dB
Target for MP fading robustness	Tolerates 12 µs frequency selective multipath fading (coding immanent)	"> 100 ns" (Source: 01229r1, Motorola)
Loss in link budget due to MP fading (RMS 400ns) - 10 <sup>-2</sup> PER - 10 <sup>-3</sup> PER	≈ - 89 dB ≈ - 89 dB	≈ - 18 dB > 32 dB
MP fading range & Coverage	Range 24x better than Halfrate $\rightarrow$ Very small holes in coverage	$\rightarrow$ Significant holes in coverage
Practical Rx sensitivity (0.18 μ CMOS)	Better than -94 dB	

# MP fading performance – Diffuse exponential model

Source Halfrate: IEEE 15-04-337-00-004b, Motorola

### PSSS –BPSK/ASK option (15/32 bit/s/Hz) – Coding example

**PSSS Symbol with 32 Chips** 

# PSSS –BPSK/ASK option (15/32 bit/s/Hz) – Precoding

- 1. Align PSSS symbol maxima symmetrical to 0
- 2. Scale PSSS symbol to amplitude limit

Original signal resolution: 4 bit Resolution after precoding: 5 bit

Note:

Higher resolution further improves performance, but does not limit interoperability

## Crystal quality – Tolerated frequency offset

- Performance against frequency offset • *Original target in TG4: Up to*  $\pm 40$ *ppm* 
  - Assumptions for chip clock:
    - PDU length 127 Byte = 8\*127 bit = 1016 bit
    - 15 bit per PSSS Symbol (32 chip)
    - $\rightarrow$  68 PSSS Symbols with 2176 chips (Chip duration Tc= 2µs)
  - Results
    - 40ppm for 2176 chips =
- 0.087 chip error for the whole PDU
- For one PSSS Symbol with 32 chips the error is about 40 ppm\*32 chip =

0,00128 chip

#### No influence to PSSS Performance by ±40ppm and worse crystal

# Linearity – Transfer function for non-linear system simulated

## Linearity – Simulation results

Slide 29 Andreas Wolf, Dr. Wolf & Ass. - Hans van Leeuwen, STS

Submission

## Linearity - Conclusions

- PSSS works even with 20% non linear PA and LNA
- PA and LNA designs are available off-the-shelf with
  - No increase in chip cost even for linearity of 2%
  - No additional power consumption compared to C class PA used in IEEE802.15.4-2003 today
- No impact of linearity requirements on power consumption
  - Reviewed and confirmed with two large semiconductor manufacturers
- No implementation risk due to increased linearity required for PSSS !

#### Non-linearity simulations are confirmed with PSSS prototype

Note:

Raised cosine pulse shaping in IEEE802.15.4-2003 2.4 GHz in baseband requires higher linearity than binary signal – Class-C PA insufficient

## Chip size and power consumption

#### **Chip size**

- High tolerance towards non-linearity and simplicity of PSSS minimizes increase in analog part
  - Estimate  $0.25 \text{ mm}^2 \text{ max}$ .
- Digital part: No increase expected due to reduced complexity.
- Total increase: 7-10 % PHY max. 4-6 % TRx die 2-3 % SoC die < 2% SoC cost !
- Increase in size also for Halfrate for required dual radio core
- PSSS proposal option with BPSK/ ASK would even reduce chip sizes

#### **Power consumption**

- High tolerance against non-linearity and simplicity of PSSS minimizes increase in power consumption
  - Estimate Rx/Tx: 5-10% max. Sleep: <0.05 μA
- 15.4 2.4 Ghz chips today spread between 15...55 mA Rx
  - Effect of implementation + process is large vs. increase from PSSS (if any)
- No visible change in battery lifetime
  Most anarry for sloop | discharge
  - Most energy for sleep+discharge
  - Longer battery life vs. current 868/915
- Increase expected also for Halfrate due to required dual radio core
- PSSS proposal option with BPSK/ ASK has even lower power needs

Assumption: 0.18  $\mu$  CMOS process

#### Status

- PAR compliance
- Summary

#### Status

• Comprehensive research and development on PSSS has been performed based on:

- Full simulation

- Configurable prototype for PSSS
- Analytical model for PSSS

Minimal risk for implementation due to well understood technology and all building blocks being widely available

# PAR compliance

- PSSS as proposed is *derivative* of current 2.4 GHz PHY *fulfills PAR* 
  - 32-chip base codes, shifted to derive multiple codes
  - 32 complex chips per symbol in airlink
  - 8x parallel use of 2.4 GHz PHY coding scheme
  - Use of O-QPSK / I/Q modulation
- Confirmed by TG4b task group in May 2004 meeting Discussion / review found unanimously that "nothing that is presented here is against the PAR" (minutes in IEEE 15-04-0272-00-004b)
  - Basis for this statement was a comparison presented and discussed based on the March presentations of PSSS (IEEE 15-04-121-03-004b) and Halfrate
- BPSK/ASK option proposed is based on OEM / chip requirement
  - Reduction of complexity and cost due to single radio core
- If we interpret "derivative" as "identical at half the clock rate" we likely miss the market opportunity with TG4b and open for competition
  - Only Halfrate fulfills "narrow" interpretation but cannot be used in Europe
  - We need to fulfill the PAR *and* the requirements to build a successful standard

## Summary

- The proposed parallel reuse of the 2.4 GHz 802.15.4 modulation technology in PSSS offers highly attractive performance improvement increasing market opportunities
  - Higher date rate and multiple channels possible in both current *and* upcoming European band and certainly also in 915 MHz band
- Significantly stronger multipath fading robustness in PSSS up to 2  $\mu$ s
  - Visibly higher range in many attractive, high volume target areas
- 7.5x higher spectral efficiency through PSSS compared to the current PHY for 868/915 MHz – 8x higher vs. Halfrate proposal
  - Enables higher data rates for lower power consumption
  - Turns duty cycle limits in Europe into protection against interference
  - More efficient use of spectrum and resulting better coexistence
- Very easy backward compatibility to the 2.4 GHz PHY, also easy adaptation to current 868/915 MHz designs
  - PSSS is derivative superset of current 2,4 GHz PHY technology
  - Automatic fallback to current 15.4 868/915Mhz standard easily possible

#### Only proposal that fulfills all key OEM requirements
