1.1.2 Catch-all reason code

CID 51

Clause 7.5.1.2 Association response

- 9-255254 -> Reserved
- 255  -> Other failure

Clause 7.5.1.3 Disassociation request

- 5-255254 -> Reserved
- 255  -> Other failure

Clause 7.5.6.2 Channel time response

- 13-255254 -> Reserved
- 255  -> Other failure

Clause 7.5.7.4 Remote scan response

- 3-255254 -> Reserved
- 255  -> Other failure

Clause 7.5.8.4 SPS configuration response

- 5-255254 -> Reserved
- 255  -> Other failure

1.1.3 PNID selection.

The PNID is chosen by the PNC when it starts the piconet and shall only be changed if the PNC detects another piconet with the same PNID on any channel. The PNC shall choose a PNID when it starts a piconet.
the PNIC should be selected randomly. An existing piconet’s PNIC shall be changed only if the PNC detects another piconet with same PNIC on any channel. The same PNIC may be persistent when the PNC restarts a piconet that ended without handing over control to a PNC capable DEV.

1.2 Multicast

DEV needs to leave an join a multicast group based on starting and stopping an application.

Idea:

Have DEVs send a request to the PNC to join a multicast group.

If the group does not exist, the PNC assigns a DEVID to the group.

If the group does exist, the PNC will use the existing DEVID.

The PNC responds to the DEV with this DEVID.

The PNC can also refuse the request due to lack of DEVIDs, handover in progress, size of group, too many groups, resources unavailable, other failure.

The DEV can leave a multicast group, this always succeeds, but the PNC does send a response. When the last DEV leaves the multicast group, the PNC deletes the DEVID and any CTAs.

The PNC deletes a DEV from a multicast group when it is disassociated.

This is optional for a DEV but mandatory for a PNC. The PNC is not required to support any multicast groups in any number.

In the PNC Information command the multicast group DEVIDs (MestGrpID) does not appear.

During PNC handover, the current PNC uses the Announce command to send the multicast group information in the Multicast Group IE. This has the 8 octet Multicast Address, 1 octet assigned DEVID. DEVs may request this IE from the PNC, they shall request it from another DEV, a PNC shall not request it from a DEV. The PNC may send this IE in a Announce command, a DEV shall send this IE in an Announce command.

The new PNC may delete any or all multicast groups. If so, it deletes the MestGrpID and terminates all of the streams. All DEVs in multicast groups shall rejoin the multicast group following a PNC handover. A DEV rejoins a multicast group by sending the Multicast Group Request command with the appropriate fields.

Need to add DestID to MLME_MULTICAST_SETUP, and an enumeration that indicates which one is to be filtered.

Change Table 48 as shown in Table 2:

Add the following subclause to 7.4 prior to 7.4.17.
Table 2—Information elements

<table>
<thead>
<tr>
<th>Element ID hex value</th>
<th>Element</th>
<th>Subclause</th>
<th>Present in beacon</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

1.2.1 Multicast Group

The Multicast Group IE is used to list the DEVs that are a member of a multicast group. The Multicast Group IE shall be formatted as illustrated in Figure 1.

<table>
<thead>
<tr>
<th>octets: 1-32</th>
<th>1</th>
<th>1</th>
<th>8</th>
<th>1</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group IDs</td>
<td>Start DEVID</td>
<td>McastGrpID</td>
<td>Multicast address</td>
<td>Length (=11 to 42)</td>
<td>Element ID</td>
</tr>
</tbody>
</table>

Figure 1—Multicast Group information element format

The Multicast Address field is the is a 64 bit MAC address that is used for multicast traffic as defined in IEEE Std. 802.0.

The McastGrpID field contains the DEVID that has been assigned by the PNC for the address in the Multicast Address field.

The Start DEVID field indicates the DEVID that corresponds to the first bit in the Group IDs field.

The Group IDs field contains a bitmap of 1 to 32 octets in length. Each bit of the Group IDs field when set to one indicates the DEV whose DEVID is equal to the start DEVID plus the bit position in the Group ID bitmap is a member of the multicast group identified by the Multicast Address and McastGrpID fields. The bits in the Group IDs field is set to zero otherwise. The bit position 0, i.e. the first bit or lsb of the bitmap corresponds to the start DEVID.

The bits corresponding to the PNCID, UnassocID, BcastID, McastID, NbrIDs and the reserved DEVIDs, 7.2.3, shall be set to zero upon transmission by the PNC and shall be ignored upon reception.

Add the two rows in Table 3 to Table 50.

Table 3—Command types

<table>
<thead>
<tr>
<th>Command type hex value b15-b0</th>

<td>Multicast configuration response</td>
<td>7.5.10.2</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Add the following subclause at 7.5.10 or later.

1.2.2 Multicast configuration commands

1.2.2.1 Multicast configuraton request

The Multicast Configuratons Request command by a DEV to to request a McsGrpID, <xref 7.2.3>. The DestID shall be set to the PNCID. The Multicast Configuration Request command shall be formatted as illustrated in Figure 2.

<table>
<thead>
<tr>
<th>octets: 8</th>
<th>1</th>
<th>2</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast address</td>
<td>Action</td>
<td>Length (=9)</td>
<td>Command type</td>
</tr>
</tbody>
</table>

**Figure 2—Multicast configuration request command format**

The Action field shall be set as indicated in Table 4.

<table>
<thead>
<tr>
<th>Action field value</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

</tr>
<tr>
<td>2-255</td>
<td>Reserved</td>
<td></td>
</tr>
</tbody>
</table>

Table 4—Action field values.

The Multicast Address field is defined in 7.4.17.

1.2.2.2 Multicast configuration response

The Multicast Configuratons Response command is used by the PNC to respond to a request for a multicast DEVID. The SrcID shall be set to the PNCID. The Multicast Configuration Response command shall be formatted as illustrated in Figure 3.

<table>
<thead>
<tr>
<th>octets: 1</th>
<th>1</th>
<th>8</th>
<th>2</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason code</td>
<td>McsGrpID</td>
<td>Multicast address</td>
<td>Length (=10)</td>
<td>Command type</td>
</tr>
</tbody>
</table>

**Figure 3—Multicast configuration response command format**

The Multicast Address field is defined in 7.4.17.

If the request for a multicast ID was successful, the McsGrpID field is the DEVID, <xref 7.2.3>, that has been assigned by the PNC for the address in the Multicast Address field. Otherwise, the McsGrpID field shall be set to zero.

The valid values of the Reason Code are:

- 0 -> Success
- 1 -> Failure, lack of DEVIDs
- 2 -> Failure, handover in progress
--- 3 -> Failure, resources unavailable
--- 4 -> Failure, not a valid multicast address.
--- 5-254 -> Reserved
--- 255 -> Other failure

Add new subsection to 8.5 as 8.5.3.

1.2.3 Multicast group configuration

Multicast addresses are defined in IEEE Std. 802-2001. Because this standard uses DEVIDs for addressing, the PNC needs to assign a DEVID to be used for a multicast address. The PNC also keeps track of all of the DEVs that request the use of a particular multicast address by maintaining a list of their DEVIDs and the associated multicast address. A group of DEVs that have been registered with the PNC using a particular multicast address are called a multicast group.

A DEV requests a DEVID for a multicast address, called a McastGrpID, from the PNC using the Multicast Configuration Request command, 1.2.2.1, with the Multicast Address field set to the desired multicast address and the Action field set to “Join.” If a McastGrpID is not currently assigned as a DEVID for that Multicast Address and the PNC has the resources available, the PNC should assign an McastGrpID for the Multicast Address and respond to the originating DEV with the Multicast Configuration Response command, 1.2.2.2. If the request was successful, the PNC adds the originating DEV to the multicast group associated with the McastGrpID.

If the PNC has already assigned a McastGrpID for the address in the Multicast Address field and the PNC has the resources available, it shall add the originating DEV’s DEVID to the multicast group.

If the originating DEV’s request is granted, the PNC shall send the Multicast Configuration Response command to the originating DEV with the McastGrpID field set to the value assigned to that multicast address and the Reason Code field set to “Success.”

If the address in the Multicast Address field does not correspond to a valid multicast address, IEEE Std. 802-2001, the PNC shall not assign a McastGrpID and shall send the Multicast Configuration Response command to the originating DEV with the McastGrpID set to zero and the Reason Code field set to “Failure, not a valid multicast address.”

If the PNC is unable to fulfill the originating DEV’s request for a McastGrpID, the PNC shall send the Multicast Configuration Response command to the originating DEV with the McastGrpID set to zero and the Reason Code field set to the appropriate value.

When a DEV no longer needs to use the multicast address, it shall send the Multicast Configuration Request command to the PNC with the Multicast Address field set to the address and the Action field set to “Leave.” When the PNC receives this command, it shall remove the DEV from the multicast group and respond with the Multicast Configuration Response command with the McastGrpID field set to zero, the Multicast Address field set to the same value as in the request command and the Reason Code field set to “Success.” The PNC shall always respond to a properly formatted Multicast Configuration Request command with the Action field set to “Leave” with a Multicast Configuration Response command with the Reason Code set to “Success.” If the address in the Multicast Address field corresponds to an multicast group that has the originating DEV as a member, the PNC shall remove the DEV from the multicast group.

If the PNC is unable to support an existing multicast group, it shall (terminate all streams using the McastGrpID using the procedure in 8.5.1.3 and places the Association IE in the beacon. This adheres to the beacon repeat characteristics in 8.5.2. When a DEV sees the Association IE in the beacon with status=disassociated, the DEV will know that the multicast group no longer exists.).
If a multicast group no longer has any members, either due to disassociation or requests from the DEVs to leave the group, the PNC shall de-allocate the MestGrpID. A MestGrpID shall be allocated and re-used according to the rules for assigning DEVIDs in 8.3.1. A MestGrpID shall not be reported in the PNC Information command.

During PNC handover, the old PNC shall send one or more Announce commands, <xref>, to the new PNC with the Multicast Group IEs, <xref>, that correspond to the MestGrpIDs that are currently in use.

The MSC for a DEV successfully joining a multicast group is illustrated in Figure 4.

![Figure 4—Message sequence chart for a DEV successfully joining a multicast group.](image-url)
The MSC for leaving a multicast group is illustrated in Figure 5

![Message sequence chart for a DEV leaving a multicast group.](image-url)

**Figure 5**—Message sequence chart for a DEV leaving a multicast group.

### 1.3 Broadcast-to-Broadcast allocations

Summary:

Non-unicast source CTAs are assigned by the PNC when it feels like it. They are allocations in the regular sense.

No one except the PNC can terminate a non-unicast source stream.

The PHY determines the access method (slotted-aloha or CSMA/CA) for a CTA when the SrcID is one of BcastID, McastID or McastGrpId. DEVs can request the frequency and duration of these types of CTAs with a modified channel time request command.

A request for a non-unicast source CTA can use any stream index.

The standard will have the following definitions:

- CTA - Time allocated in the superframe
- Regular CTA - non-contention based CTA (at least initially)
- Open CTA - Contention based CTA, there are multiple sources possible.
- Private CTA - Unicast SrcID that is also the DestID.
- Association CTA - Contention based CTA, only used for associating DEVs, SrcID = UnassocID.

Clause 7:

Add the following definitions for the CTRq command:
— A request with the PNCID as the DestID and the stream index set to the MCTA index indicates that the DEV is requesting a change in the frequency and/or size of allocations that the PNC provides with the DEV’s.

Clause 8:

— The PNC can allocate CTAs with the both the SrcID and DestID set to be the BestID. These are open CTAs that use contention based channel access rather than having a single DEV with the transmit control. If the MCTA Used bit in the Piconet Synchronization Parameters field in the beacon is set to one, then the open CTAs will use slotted-aloha as the access method. Otherwise the open CTAs will use the CSMA-CA as the access method.

— DEVs cannot request termination of an open CTA. They can modify their request so that they are not requesting any time, however.

— A DEV can request that the PNC adjust the frequency and duration of open CTAs by sending a CTRq command with the destination address set to the broadcast address and the stream index set to the MCTA index

Types of CTAs used in the piconet are (Put this in an informative annex as well):

<table>
<thead>
<tr>
<th>CTA type</th>
<th>SrcID/DestID</th>
<th>Stream Index</th>
<th>Access method(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAP</td>
<td>N/A</td>
<td>N/A</td>
<td>Uses CSMA/CA, not a real CTA, but it is assigned time in the super-frame.</td>
</tr>
<tr>
<td>Regular CTA</td>
<td>Any valid single DEVID*</td>
<td>A regular stream index</td>
<td>TDMA with transmit control transfer</td>
</tr>
<tr>
<td>Regular MCTA</td>
<td>PNCID and any valid single DEVID</td>
<td>MCTA stream index</td>
<td>TDMA with transmit control transfer. This is the same functionality as a regular CTA.</td>

</tr>
<tr>
<td>Open CTA</td>
<td>BestID/BestID</td>
<td>Asynchronous stream index</td>
<td>Slotted aloha or CSMA/CA as determined by PHY.</td>
</tr>
</tbody>
</table>

*A single DEVID is a DEVID that corresponds to a single physical device

Only one contention access method is used by a PHY type.

Different allocations can be requested with the CTRq command. Put this in an informative annex, possibly with the security information. These are listed in Table 6.
Table 6—Interpretation of Parameters in a Channel Time Request command

</tr>
</tbody>
</table>

1.3.1 (5.2.2)

Update the summary clause to match.

1.3.2 Channel access

At the end, add a paragraph that indicates that the PHY type determines the contention access method that will be used. Only one type of contention access method is used by a PHY.

1.3.3 (8.4.3.3) Management CTAs

*Change the first paragraph to read*

Management CTAs (MCTAs) are identical to CTAs except that the PNCID is either the SrcID or the DestID in the CTA and the stream index is set to the MCTA stream index, as described in 7.2.5.

... Add descriptions for how a DEV requests Open MCTA and Open CTA time along with existing requests for Regular MCTA time.

Change the text that indicates that the access method for open MCTAs and association MCTAs are determined by the PHY and are not necessarily slotted aloha.
2. Proposals

This section contains proposals for solutions. These proposals have not necessarily been approved or disapproved.

2.1 2-way CTAs

Need to add a new command, suggested format is as follows:

*Added the following to 7.5.9 as 7.5.9.3*

2.1.0.1 Relinquish CTA time command

The Relinquish CTA Time command enables a DEV to release a period of time in a CTA to be used by another DEV, &lt;xref 8.4.3.3&gt;. The ACK Policy field in the MAC header shall be set to no-ACK. The Relinquish CTA Time command shall be formatted as illustrated in Figure 6.

<table>
<thead>
<tr>
<th>octets: 2</th>
<th>2</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relinquish end time</td>
<td>Length (=2)</td>
<td>Command type</td>
</tr>
</tbody>
</table>

*Figure 6—Relinquish CTA command format*

The Relinquish End Time field indicates the time in μs measured from the beginning of the superframe by which the DEV that is the DestID of this command will no longer be able to transmit in the current CTA. The rules for using this command are specified in &lt;xref 8.4.3.3&gt;.

*Add the following text as a new subclause, 8.4.3.3 (subsequent subclauses will be renumbered) or as the last paragraphs in 8.4.3.2.*

2.1.0.2 Relinquishing CTA time to another DEV

The PNC gives transmit control to the DEV that is the SrcID of a CTA for the duration of the CTA. The DEV that has transmit control in a CTA may, subject to the restrictions in this subclause, relinquish a som or all of the remaining time in a CTA to another DEV. The DEV that relinquishes the channel time is referred to as the originating DEV while the DEV which is given the transmit control of the time in the CTA is referred to as the target DEV. The DEV that is the SrcID of the CTA begins the CTA with transmit control for the CTA.

The originating DEV relinquishes transmit control of the time in the CTA to the target DEV by sending the Relinquish CTA Time command to the target DEV with the Relinquish End Time field set appropriately, &lt;7.5.x.x&gt;. The originating DEV shall have control over access to the CTA when it has received the command.

The originating DEV may relinquish any portion of the time in the CTA up to the end of the CTA. If the value of the Relinquish End Time field is less than the end time for the CTA, the target DEV is given transmit control for only a portion of the CTA. Transmit control returns to the originating DEV either when the time in the Relinquish End Time field occurs or when it receives a Relinquish CTA Time command from the target DEV prior to the time indicated in the Relinquish End Time field.

(note: Add note about guard time).
If the value of the Relinquish End Time field is equal to or greater than the end time for the CTA, the target DEV has been given transmit control for the remainder of the CTA. Regardless of the value of the Relinquish End Time field, transmit control returns to the PNC at the end of the CTA.

(Note the originating DEV shall not set it to longer than Relinquish End Time. If a DEV has not received a beacon, it shall not send the Relinquish End Time command.)

If target DEV has been given transmit control for only a portion of a CTA, it shall not hand over transmit control to any other DEV in the piconet. In this case, the target DEV may return transmit control to the originating DEV using the Relinquish CTA Time command. In this case, the originating DEV ignores the value of the Relinquish End Time field.

If a DEV has been given transmit control for the remainder of the CTA, it may handover transmit control to another DEV in the piconet.

(note: new field here, modify figure 5 with new field.).

If the destination DEV has data that it needs to send, it may use the time provided by the source DEV to send data frames, as illustrated in Figure 7. The destination DEV that has transmit control in a CTA is not required to use it only for communication with the source DEV. It may send frames to any device in the piconet, but it should only send frames if it determines that the destination of its frames will be listening during that time.

![Figure 7—Message sequence chart for relinquishing CTA time when the destination DEV has data to send.](image-url)
If the destination DEV does not have frames to send, then it may either hand the transmit control back to the source DEV using the Relinquish CTA Time command <xref 7.5.x.x> or control will return to the source DEV when the relinquish time has expired.

![Message sequence chart for relinquishing CTA time when the destination DEV does not have data to send.](image)

(Need one with a Relinquish CTA time command responding and change timer finishes to be correct.)

2.3 Proposed Security Annex
Annex A

(informative)

Informal security analysis

A.1 Introduction

A useful number for this discussion is the number of \( \mu \)s in a year.

\[
1 \text{year} = 365 \times 24 \times 60 \times 60 \times 10^6 = 3.1536 \times 10^{13} \mu s \approx 2^{45} \mu s
\]

A.2 Key usage

In general, a 128 bit AES key used in piconet should not be used more than \( 2^{64} \) times to produce an IC or to encrypt a frame. If a DEV sends a frame encrypted by a key once every microsecond, it would send approximately \( 2^{45} \) frames every year. Thus, to avoid security problems, an implementation should change its management keys at least once every \( 2^{19} = 524,288 \) years. More conservative implementations that are concerned with security should change management keys at least once every millenium.

Even if the DEV is able to send an encrypted frame once every nanosecond, it would transmit approximately \( 2^{45} \) frames every year and so the key should be changed at least once every 585 years. Of course, after 585 years, computation power will have increased dramatically and 128 bit AES keys likely will no longer be considered to be secure.

A.3 Replay attacks

The 802.15.3 symmetric key encryption suite

2.4 Montag in Berlin, 13.09.04

Database is 15-04-0334-05

CID 81 - Accept in principle

7.5.6.1 ?????

Change xx paragraph as indicated

For instance, in the case where the CTA Rate Type field is set to zero, a value indicating a super-rate CTA request, and the CTA Rate Factor field contains a value \( N \) greater than zero, the requesting DEV is requesting super-rate CTAs from the PNC. If these super-rate CTAs, are allocated by the PNC, they will appear \( N \) times per superframe. A PNC shall support at least 8 CTAs per stream in the same superframe. The CTA Rate Type field set to zero and the CTA Rate Factor set to zero shall be reserved.

CID 77 and 78: Change to clarify 7.5.6.1. Tabled until Dienstag.
CID 79: Wanted to bring this to the communities attention. Take to the email reflector and off site people today for discussion.

What if the PNC can’t allocate the CTA Rate Factor, does the PNC respond with failure or let the DEV see the result and terminate if the DEV doesn’t like the allocation.

Is the PNC currently required to notify a DEV if the PNC is no longer able to provide the minimum number of TUs in the allocation?

CID 80: Accept in principle

Make an exception in 7.4.1: "The exception is null CTAs (8.5.1.3), which shall be the last in the sequence of CTABs in the beacon."

Delete last 2 octets in Dly-ACK, no CID submitted. Table until Mittwoch, discuss off-line.

2.5 Donnerstag in Berlin, 16.09.2004

2.5.1 Stream creation at the MLME

1) There are two components of the QoS management, a admission (or bandwidth manager?) control component and a channel control component.

The bandwidth manager is or does: (possibly in FCSL)

- Admission control: Can the stream request be serviced?
- Has knowledge of the policy based on application requirements
- May have communication with the remote device for negotiating QoS at higher layers.
- For a particular application, it knows the limits of the resources and the failure point
- Has some view of resource sharing, e.g. multiplexing data.

The channel control component (or radio link control) is (definitely in MAC):

- Maintains QoS parameters in a changing wireless environment
- Tries to implement the specification of the stream within the boundaries set by the higher layers
- Manages the air interface to ensure delivery
- Manages the air interface to maximize throughput and minimize latency.
- If conditions become untenable or the DEV disappears, it reports this back to the admission control component
- Requires detailed, timely information of the status of the stream.

When does the bandwidth manager get involved? For the wired case, it is only involved during connection setup and teardown. With the correct parameters passed to the RLC, this is true for wireless as well. In addition, the bandwidth manager will also get failure notices from the RLC. The bandwidth manager will decide if the change in the medium is sufficient to cause the stream to fail or to struggle on.

Possible specifications for a stream are

What we have now

- Range of time of total time on the air per unit of time and range of the frequency of allocation.
- Assumed data rate on the air?
- Add a minimum service interval? It would map into CTA Rate factor.
— Need indication back from the MAC with: Actual data rate, reduce allocation from PNC, congestion in shared time allocations, bandwidth available, superframe size change?

802.11e TSPEC

— Nominal MSDU Size
— Maximum MSDU Size
— Minimum Service Interval
— Maximum Service Interval
— Inactivity Interval
— Suspension Interval
— Service Start Time
— Minimum Data Rate
— Mean Data Rate
— Peak Data Rate
— Maximum Burst Size
— Delay Bound
— Minimum PHY Rate
— Surplus Bandwidth Allowance
— Medium Time

Suggestion 1: Time and frequency with ranges tweak on what we have.

Does the congestion information have to do with a specific CTA. What are the parameters of an indication

How does a DEV find out about the super-rate not being supported?

- Request is refused by PNC
- Probe PNC for new Bandwidth Allocation Reservation Requirements (BARR) IE?

3. San Antonio

3.1 Stream creation and modification

— ACK policy
— Number of retries
— Sharing policy
— Rate set
— Maximum fragment size
— Minimum allocation size
— Inter-allocation spacing (expressed OTA as Rate Type and Rate Factor)
— Amount of channel time including application specific overhead based on reliability requirements
— Delivered throughput
— Expected packet loss rate
— TargetID
— Stream request ID (handle)
— UserPriority (?)
Confirm parameters

- StreamRequestID
- ResultCode

What about simple

- Throughput - Mb/s
- Reliability - Number of retries
- Latency - max time in ms measured from when the MSDU arrives until it is either delivered or dropped MSDU including retries
- Priority
- Max data frame size (Octets)
- ACK data?
- SECMode
StreamGroupID (0 is no group) (Sharing strategy defined by the MAC)

```
MLME-CREATE-STREAM.req(
    RequestID,
    TrgtID,
    SourceDataRate
    MaxRetries,
    MaxTransmitDelay,
    Priority,
    MaxDataFrameSize,
    SECMode,
    StreamGroupID)
```

Note: If sharing is selected the MAC will fairly use the time available for all the streams in the group.

Question: Was SECMode left out of 15.3 Stream Request on purpose or is it missing? Does SECMode need to be a parameter for stream management primitives?

Answer: SECMode was missing in 15.3

Scenario:

Application knows:
— SDTV - 8 Mb/s compressed, CBR.
— Buffer restricts the latency to less than 20 ms.
— Priority = very, really important.
— Retry limit = 4
— Alternative streams can be shared an allocation primarily dedicated to this stream
— Typical frame size = 1000 octets

MAC knows:

FER = 5%

— Data rates available to DEV: 22, 33, 44
— Superframe duration = 10 ms
— Policy is Imm-ACK.
— Overhead is ?? us per frame

Calculations:

Assume 44 Mb/s to start. Need 8 Mb/s / 8000 bits/frame = 1000 frames/second.

With retries, need 5.1% (round to 5 %) = 1050 frames/second.

Time per frame is = 8000 bits/44 Mbs + 50 us overhead = 232 us/frame

In each superframe we need to send 1050 frames/second * 10 ms/superframe = 11 frames/superframe

TU = 232 us, 11 TUs per superframe. Total time is 2.552 ms/superframe.

2*10 - 2.6 = 17.4 ms > 10 ms,

(10-2.6)/2 = 3.7 so use superrate with RateFactor = 4

Request is TU = 232 us, Minimum Number of TUs is 11, CTA Rate Type = 0, CTA Rate Factor = 1

MaxRetries (0 is none with ACK, 65,535 is none with no-ACK)

Allow the PAL to "group streams together and assigns a unique identifier".

The parameters used for these primitives are defined in Table 7.

</tbody>
</table>
3.1.1 MAC-ASYNC-DATA.request

This primitive is used to initiate the transfer of an asynchronous data from one MAC entity to another MAC entity or entities. The semantics of this primitive are:

MAC-ASYNC-DATA.request ( RequestID, 
TrgtID, 
MaxRetries, 
TransmitTimeout, 
SECMode, 
ConfirmRequested, 
Length, 
Data ) 

The primitive parameters are defined in Table 7.

3.1.1.1 When generated

This primitive is sent by the FCSL to the MAC SAP after receiving an MA-UNITDATA.request from the LLC sublayer.

3.1.1.2 Effect of receipt

The MAC upon receiving this primitive uses the received parameters to format an appropriate MPDU which is then sent to the PHY-SAP for transfer over the wireless medium to a peer MAC entity or entities. If the ACKPolicy in the request is set to DLY_ACK, the MAC will take no action except to return a MAC-ASYNC-DATA.confirm with the ResultCode set to INVALID_ACK_POLICY.

3.1.2 MAC-ASYNC-DATA.confirm

This primitive is used to inform the FCSL of a successful delivery or a failed delivery. The semantics of this primitive are:

MAC-ASYNC-DATA.confirm ( RequestID, 
TransmitDelay, 
ResultCode, 
ReasonCode ) 

The primitive parameters are defined in Table 7.

3.1.2.1 When generated

This primitive is generated by the MAC upon either a successful delivery or an unsuccessful delivery. An unsuccessful delivery results either due to a TX_TIMEOUT expiration or because the maximum number of allowed retries has been exceeded without receiving an Imm-ACK (assuming the ACKPolicy parameter was set to IMM_ACK). If the ACKPolicy in the corresponding request was set to DLY_ACK, the ResultCode will be set to INVALID_ACK_POLICY.
3.1.2.2 Effect of receipt

The FCSL, upon receiving this primitive from the MAC, will send an MA-UNITDATA-STATUS.indication.

3.1.3 MAC-ASYNC-DATA.indication

This primitive is used to indicate the reception of an asynchronous MSDU. The semantics of this primitive are:

MAC-ASYNC-DATA.indication
   ( OrigID,
     TrgtID,
     SECMode,
     Length,
     Data
   )

The primitive parameters are defined in Table 7.

3.1.3.1 When generated

This primitive is generated by the MAC upon successfully processing a received asynchronous MSDU.

3.1.3.2 Effect of receipt

When the FCSL receives this primitive from the MAC it will generate an MA-UNITDATA.indication.

3.1.4 MAC-ISOCH-DATA.request

This primitive is used to initiate the transfer of an isochronous MSDU from one MAC entity to another MAC entity or entities. The semantics of this primitive are:

MAC-ISOCH-DATA.request
   ( RequestID,
     StreamIndex,
     TransmitTimeout,
     MaxRetries,
     SECMode,
     ConfirmRequested,
     Length,
     Data
   )

   { If ConfirmRequested is TRUE, all transmit attempts are sent with Imm-ACK policy. If ConfirmRequested if FALSE, the last frame may be sent with a No-ACK policy. A MAC-ISOCH-DATA.cnf is only returned if ConfirmRequested is TRUE. }

The primitive parameters are defined in Table 7.

3.1.4.1 When generated

This primitive is sent by the FCSL to the MAC SAP after receiving an MA-UNITDATA.request from the LLC sublayer and then assigning it an appropriate StreamIndex.
3.1.4.2 Effect of receipt

The MAC upon receiving this primitive uses the received parameters to format an appropriate MPDU which is then sent to the PHY-SAP for transfer over the wireless medium to a peer MAC entity or entities. If the StreamIndex for the request does not correspond to an existing stream with the DEV as the source, the MLME will not attempt to transmit the frame and will respond with a MAC-ISOCH-DATA.confirm with a ResultCode of INVALID_STREAM.

3.1.5 MAC-ISOCH-DATA.confirm

This primitive is used to inform the FCSL of a successful delivery or a failed delivery. The semantics of this primitive are:

MAC-ISOCH-DATA.confirm (RequestID, StreamIndex, TransmitDelay, ResultCode, ReasonCode)

The primitive parameters are defined in Table 7.

3.1.5.1 When generated

This primitive is generated by the MAC upon either a successful delivery, or an unsuccessful delivery. An unsuccessful delivery results either due to a TX_TIMEOUT expiration or because the maximum number of allowed retries has been exceeded without receiving an Imm-ACK (assuming the policy parameter was set to IMM_ACK). If the Dly-ACK policy was used, but the destination refused the use of Dly-ACK, the ResultCode is set to DLY_ACK_FAILED. This indicates successful transmission of the corresponding data frame.

3.1.5.2 Effect of receipt

The FCSL, upon receiving this primitive from the MAC, will send an MA-UNITDATA-STATUS.indication.
3.1.6 MAC-ISOCH-DATA.indication

This primitive is used to indicate the reception of an isochronous MSDU. The semantics of this primitive are:

MAC-ISOCH-DATA.indication ( 
  TrgID, 
  OrigID, 
  StreamIndex, 
  SECMode, 
  Length, 
  Data 
)

{ TrgID needed for Multicast Group and maybe data to PNCID. OrigID needed because target may not yet know about stream }

The primitive parameters are defined in Table 7.

3.1.6.1 When generated

This primitive is generated by the MAC upon successfully processing a received isochronous MSDU.

3.1.6.2 Effect of receipt

When the FCSL receives this primitive from the MAC it will generate an MA-UNITDATA.indication.

3.2 What is priority?

Priority is used for admission control and stream maintenance. Streams with equal priority are allocated by the PNC on a first come first serve basis. Lower priority streams may have their available time reduced or the stream terminated by the PNC to serve higher priority streams. Priority has a range of 0-7 with 7 being the highest priority level. Priority is not associated in any way with UserPriority (as currently indicated in the standard).
