Re: [Response to LB comment of TG7]

Abstract: [This document describes LB comment resolution related to 5.5.3.1.]

Purpose: [To resolve LB comments related to 5.5.3.1]

Notice: This document has been prepared to assist the IEEE P802.15. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release: The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by P802.15.
LB comment resolution related to 5.5.3.1

- 8 CIDS : 85, 89, 86, 91, 95a, 95c, 76, 95
Old text in 5.5.3.1 of D1

- The flicker means the periodic or non-periodic brightness fluctuation human eye can perceive. It can be injurious to human eye and human health. Therefore, the standard supports flicker compensation. Infrastructure devices and coordinators shall be compliant to all applicable regulations in regards to flicker compensation.

- The flicker in VLC is classified into two categories, intra-frame flicker and inter-frame flicker, according to its generation mechanism. Intra-frame flicker means the flicker appears from the brightness discrepancies between the bit patterns of "1"s and "0"s inside data frame, and inter-frame flicker indicates the flicker appears from the average brightness discrepancy between the packet frame transmission time and the idle time which means non-transmission time. The possibility which the flicker appears is higher in low data rates than in high data rates. The details on the flicker compensation technologies are described in 5.5.4 and 6.9.6.
New text 5.5.3.1 merged with 5.5.4
(See 10/463/r1 and 10/485/r0)

- Flicker is defined as unexpected and unpredictable brightness fluctuations that are perceptible by the human eye and can be injurious to human health; therefore, this standard supports flicker compensation. All devices shall be compliant to all applicable regulations in regards to flicker.

- The maximum flickering time period (MFTP) is defined as the maximum time period over which the light intensity can be changing but the resulting flicker is not perceivable by the human eye [B37]. To avoid flickering in VLC, the brightness of each MFTP needs to be all equal.

- The flicker in VLC is classified into two categories according to its generation mechanism: intra-frame flicker and inter-frame flicker. Intra-frame flicker is defined as bit pattern dependent brightness discrepancies within the data frame. Inter-frame flicker is defined as the average brightness discrepancy between the packet frame transmissions and the idle time between data transmissions.
The latest text 5.5.3.1 merged with 5.5.4 (See 10/485/r2)

- 5.5.3.1 Flicker compensation mitigation
  - Flicker is defined as unexpected and unpredictable brightness fluctuations that are perceptible by the human eye and can be injurious to human health; therefore, this standard supports flicker compensation. All devices shall be compliant to all applicable regulations in regards to flicker.

- Flicker is defined as the fluctuation of the brightness of light that can cause noticeable physiological changes in humans. This standard strives for the mitigation of flicker.

- The maximum flickering time period (MFTP) is defined as the maximum time period over which the light intensity can be changing but the resulting flicker is not perceivable by the human eye [B37]. To avoid flickering in VLC, the brightness during each MFTP needs to be equal.

- The flicker in VLC is classified into two categories according to its generation mechanism: intra-frame flicker and inter-frame flicker. Intra-frame flicker is defined as bit-pattern dependent brightness discrepancies within the data frame. Inter-frame flicker is defined as the average brightness discrepancy between the packet frame transmissions and the idle time between data transmissions. The details on the flicker compensation technologies are described in 5.5.4 and 6.9.6.”

CID 89 (cont.)

5.5.3.1 Flicker Compensation

The flicker means the periodic or non-periodic brightness fluctuation human eye can perceive. It can be injurious to human eye and human health. Therefore, the standard supports flicker compensation. Infrastructure devices and coordinators shall be compliant to all applicable regulations in regards to flicker compensation.

→ The text in 5.5.3, not including its subclauses, has been deleted in the baseline text (DCN= 10/485/r0).

5.5.3.1 Flicker compensation

Flicker is defined as the fluctuation of the brightness of light that can cause noticeable physiological changes in humans. This standard strives for the mitigation of flicker.
- Intra-frame flicker may be related to clock rate, but inter-frame flicker is not related to clock rate.
- The sentence mentioned at CID 86 is not longer in the latest text as shown in slide #6.
- See slide #6.

**Recommendation/Instruction to editor**
- CID 86 : Reject
CID 91

<td></td>
<td>The grammar of subclauses 5.5.3 and 5.5.4 is, frankly, terrible, and largely unreadable. I'd submit individual comments, but as there would be an average of more than one comment per line, it would be slow going, and not very productive, since the language is so fractured it's often not clear what the writer's intent is in the first place.</td>
<td>Have someone edit these subclauses. Don't forget to correct &quot;within on layer&quot; on line 4; the placement of particles throughout 5.5.3.1; &quot;can be accomplished by three technologies&quot; on line 23 (only three technologies, or are these three of many possible that are mentioned in this standard?); the use of &quot;4B6B&quot; without definition on line 24; &quot;is resulted in&quot; on line 35; etc., etc., etc.</td>
</tr>
</tbody>
</table>
CID 95 (cont.)

• Let’s see together. So difficult because it covers all of 5.5.3 and 5.5.4, not only 5.5.3.1.

• Recommendation/Instruction to editor
  1. Accept : Have someone edit these subclauses.
  2. Accept : Correct “within on layer” on line 4.
  3. I can’t catch the commentator’s point : Correct the placement of particles throughout 5.5.3.1.→ Need some help.
  4. Accept : Correct “can be accomplished by three technologies" on line 23 (only three technologies, or are these three of many possible that are mentioned in this standard?)
CID 95 (cont.)

- **Recommendation/Instruction to editor**
  5. Do we need the definition? : Correct the use of "4B6B" without definition on line 24. → Need some help.
  6. Accept : Correct "is resulted in" on line 35;
  7. Accept : etc., etc., etc.
  8. See slide #6.
CID 95 (cont.)

5.5.3 Cross Layer Consideration

Cross layer issues require cooperation between the MAC and PHY to achieve some required specification; that is, the solution does not lie entirely within one layer. The two relevant issues in this specification are the flicker compensation and the dimming function.

→ The text in 5.5.3, not including its subclauses, has been deleted in the baseline text (DCN= 10/485/r0).

5.5.3.1.1 Intra-frame Flicker Compensation

The intra-frame flicker compensation can be accomplished by three technologies, which are the use of Manchester or 4B6B run length limiting code or VPM(Variable Pulse Position Modulation) modulation, in this

5.5.3.1.1 Intra-frame flicker compensation

Intra-frame flicker compensation is accomplished by the use of one of the following mechanisms: Manchester encoding as specified in 6.6.4.2, 4B6B encoding as specified in 6.6.4.1, 8B10B encoding as specified in 6.7.3.2 or VPPM as specified in 6.9.6 and Annex F".
The compensation method used for inter-frame flicker is the transmission of an idle pattern between data frames whose average brightness is equal to that of the data frames. The idle pattern is not specified and it is allowable to use an idle pattern symbol rate other than that used for data transmissions to avoid in-band modulation domain interference.

The text in 5.5.3.1.2 of D1, has been deleted in the baseline text (DCN= 10/485/r0).
