**Abstract**

**Purpose**

This document has been prepared to assist the IEEE P802.24. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

**Release**

The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by P802.24.
1 Background and Introduction

IEEE 802 technologies are used for a wide variety of applications and markets. Although the widespread usage and overwhelming adoption as PHY and Link layer technologies for all kind of information and communication solutions, a common perception of the value and differentiation of the IEEE 802 architecture in the context of vertical markets is not established, as well as there are no clear views about the reasons why IEEE 802 would be better suited to deployments in the communication infrastructure of private enterprise, industry, and the individual user, and how does IEEE 802 compare to network architectures oriented towards service providers.

In a first stance it could be agreed that the IEEE 802 architecture enables networks that are like Ethernet: Well understood, mature, predictable, offering a “cleaner” integration of disparate technologies under the common architecture and addressing.

This white-paper is aimed to collect and spell out commonalities of IEEE 802 technologies and sets the scene in relation to other well-known communication standards of similar behavior.

2 Requirements of Vertical Applications

This section defines the characteristics of Vertical Applications that usually integrate various systems including network connectivity in order to perform specific tasks or enable use cases for their industry.

2.1 Defining “Vertical”

In the context of this white paper, Vertical Applications refers to networks that serve specific use cases in specific market segments. The network is used by the entity to enable its business processes. This is in contrast to an access network, where the network services are the product.

Vertical markets involved specific usage models:

- Industrial automation
- Building Automation
- Smart Cities
- Smart Grid / Utility
- Automotive / transportation
- Agriculture
- Connected Supply Chain
- Critical infrastructure protection and control
- Wide area gaming (including AR/VR)

There are other ways of looking at ‘Vertical’. Vertical integration is really a competition/anti-trust term, rather than a technical term. In that context it describes a technical situation that some set of functionalities that may be provided by the same company could actually in practice also be provided by different companies. So, for instance, "5G" is "vertically integrated" because it
actually assumes in its technical specifications that a single commercial provider will be responsible for a whole range of different features that are not really separable. In that sense IEEE 802 technologies are not "vertically integrated" because they can be deployed by different operators of completely different networks (e.g. one leverages wired connections, while others are based on wireless connectivity). Nevertheless, IEEE 802 plays a role in vertical integration through providing the plain connectivity layer, e.g. IEEE 802.11 in IEEE 1609 vehicle-to-vehicle communications, or IEEE 802.15.4 in the SEP.

Vertical markets often require highly-engineered networks to guarantee the quality of the required communication services. Quite often vertical markets follow extended lifecycles; the vertical network is expected to remain in service for a longer time than a service-provider network. And vertical markets may have different cost models compared to usual public communication networks with some are opex averse, others are more capex averse.

3 Economic Aspects for Vertical Application Networks

IEEE 802 based networks are usually aimed to "enable creating/delivering a product" instead of "the network is the product" defined by a open standard:

- IEEE needs to think about how to create that package without a “subscription model”
- IEEE 802 is often free to use
- IEEE 802 is deployed in vertical markets, where the network is owned and operated by the user of the services.
- There are also other models than subscription that provide ancillary economic value.
  - An economy of scale can be accomplished by creating a network that can be leveraged by multiple entities. This is similar to the cloud thinking – the model of sharing the infrastructure (network) without the need for them to be independently installed and managed. A similar concept to a data center just providing computing resources, but not dealing with installing and running software for all the services needed.
  - The trend toward more virtualization is a strength of IEEE 802 because it allows the network to be better prepared for that virtualization. It provides the clean separation between the infrastructure and the service running on the infrastructure. In the IEEE 802 case, this is the layer 2 to layer 3 boundary.
  - The IEEE 802.3 Ethernet transport is the most well understood transport in existence. This is analogous to the X86 computer architecture that became the basis for the computing resources of data centers.
- IEEE 802 and unlicensed spectrum enables faster innovation
  - Many of the breakthrough innovations were not as planned
  - The story of why IEEE 802 complements everything else, and everything else (alone) is not sufficient.
- IoT is built around many specialized niches. The challenge is meeting their diverse requirements. No single standard can address all of them well. IEEE 802 provides multiple standards to address multiple IoT applications.
The model for network management requires special attention, when the owner/operator of the network may have less expertise in network management. Guidance is desired on how to manage and operate a private network. Usually, this is simpler because the IEEE 802 network is simpler (compared to 3GPP, for example), but the documentation is often not really mature or available. Yang modeling describes the interface, but more knowledge is needed to understand how to use the network management data that is available through the interface.

3.1.1 Modularity and Interchangeability, competition economics

A user of a vertical application may want to be able to replace parts of their vertical application network with a better, newer product when one arrives (for instance, installing a new AP when a better one is available from a different vendor). IEEE 802 products lend themselves to this form of user-empowered modularity. Building blocks with smaller functional content and broader variation offer this flexibility to the vertical application. 3GPP 5G (or cellular networks in general) does not have this modular feature. Although many vendors of UEs can be certified to the specifications, it is much harder for the network owner to mix multiple vendors in the RAN and Core of the network.

3.1.2 Possibility of small business entities deploying small scale networks

It would be possible for a small utility or municipality with only a few employees to set up a reasonably secure Wi-Fi network at their workplace, perhaps with temporary help from a consultant if they were making sure it was really secure. But they would find it much more difficult to acquire a municipal spectrum license for LTE technologies, and install, configure, and maintain a 3GPP private network infrastructure. IEEE 802 also enables a greater degree of scalability. A network that starts small can easily be scaled to more complexity and users as the business grows. A 3GPP access network is designed from the start for large scale, and is more difficult to apply at a small scale.

4 Key Aspects of the IEEE 802 Technologies for Vertical Applications

4.1 Layering

- IEEE 802 is a transport network
- IEEE 802 is Layer 2
- IEEE 802 provides direct and simultaneous support of IPv4 and IPv6 or pure layer 2 protocols
- IEEE 802 offers trade-off and optimizations between flexibility (L2) and scalability (L3)

4.2 Routing and Bridging

- IEEE 802 enables networks to scale with routing and bridging.
IEEE 802 supports layer 3 protocols such as IP, which enables routing to enable IEEE 802 networks to expand to higher scale.

- IEEE 802 networks can be built at smaller scale to provide more flexibility.
- Smaller scale provides opportunity for real-time.
- IEEE 802 standards can emulate a point to point network over a wireless point to multipoint network to enable bridging over the wireless link.
- IEEE 802 can support multiple different L3 and above protocol suites.
- IEEE 802 can also offer L2 routing when appropriate (e.g. 802.15.10)
  - Note: Not an alternative to L3 routing, but there to address a different problem.

4.3 Management and Control

- IEEE 802 does not provide as many means of control for a specific end device and its traffic on a path.
- There are some management facilities in some standards.
- It is easier for IEEE 802 to support an “unmanaged” network, such as consumer Wi-Fi.
- 802 provides local networks that may be (but don’t have to be) connected into the Internet or other networks.
- Public operator networks are focused on services for single devices, while IEEE 802 networks support and include multiple devices (networks of networks) – devices can communicate with each other as well as with other networks.

5 IEEE 802 standards aimed for vertical applications

5.1 IEEE 802 Overview and Architecture

- 802-2014 - IEEE Standard for Local and Metropolitan Area Networks: Overview and Architecture
- 802c-2017 - IEEE Standard for Local and Metropolitan Area Networks:Overview and Architecture--Amendment 2: Local Medium Access Control (MAC) Address Usage
- 802d-2017 - IEEE Standard for Local and Metropolitan Area Networks:Overview and Architecture Amendment 1: Allocation of Uniform Resource Name (URN) Values in IEEE 802(R) Standards
- 802E-2020 - IEEE Recommended Practice for Privacy Considerations for IEEE 802(R) Technologies

5.2 IEEE 802.1 Bridging and Management

- 802.1AB-802.1AB-2016 - IEEE Standard for Local and metropolitan area networks - Station and Media Access Control Connectivity Discovery
- 802.1AC-802.1AC-2016/Cor 1-2018 - IEEE Standard for Local and Metropolitan Area Networks--Media Access Control (MAC) Service Definition - Corrigendum 1: Logical Link Control (LLC) Encapsulation EtherType
• 802.1AC-802.1AC-2016 - IEEE Standard for Local and metropolitan area networks -- Media Access Control (MAC) Service Definition
• 2018/Cor 1-2020 - IEEE Standard for Local and metropolitan area networks--Media Access Control (MAC) Security Corrigendum 1: Tag Control Information
• 802.1AE-2018 - IEEE Standard for Local and metropolitan area networks-Media Access Control (MAC) Security
• 802.1AY-2018/Cor 1-2020 - IEEE Standard for Local and metropolitan area networks--Media Access Control (MAC) Security Corrigendum 1: Tag Control Information Figure
• 802.1AR-2018 - IEEE Standard for Local and Metropolitan Area Networks - Secure Device Identity
• 802.1AS-2020 - IEEE Standard for Local and Metropolitan Area Networks--Timing and Synchronization for Time-Sensitive Applications
• 802.1AX-2020 - IEEE Standard for Local and Metropolitan Area Networks--Link Aggregation
• 802.1BA-802.1BA-2011/Cor 1-2016 - IEEE Standard for Local and metropolitan area networks-- Audio Video Bridging (AVB) Systems-- Corrigendum 1: Technical and Editorial Corrections
• 802.1BR-802.1BR-2012 - IEEE Standard for Local and metropolitan area networks--Virtual Bridged Local Area Networks--Bridge Port Extension
• 802.1CB-802.1CB-2017 - IEEE Standard for Local and metropolitan area networks--Frame Replication and Elimination for Reliability
• 802.1CM-2018 - IEEE Standard for Local and metropolitan area networks -- Time-Sensitive Networking for Fronthaul
• 802.1CMde-802.1CMde-2020 - IEEE Standard for Local and metropolitan area networks -- Time-Sensitive Networking for Fronthaul - Amendment 1: Enhancements to Fronthaul Profiles to Support New Fronthaul Interface, Synchronization, and Syntonization Standards
• 2018 - IEEE Standard for Local and metropolitan area networks -- Time-Sensitive Networking for Fronthaul802.1CS-2020 - IEEE Standard for Local and Metropolitan Area Networks--Link local Registration Protocol
• 802.1Q-2018 - IEEE Standard for Local and Metropolitan Area Network--Bridges and Bridged Networks
• 802.1Qcr-802.1Qcr-2020 - IEEE Standard for Local and Metropolitan Area Networks--Bridges and Bridged Networks - Amendment 34: Asynchronous Traffic Shaping
• 802.1Qcx-802.1Qcx-2020 - IEEE Standard for Local and Metropolitan Area Networks--Bridges and Bridged Networks Amendment 33: YANG Data Model for Connectivity Fault Management
• 802.1Qcy-802.1Qcy-2019 - IEEE Standard for Local and Metropolitan Area Networks--Bridges and Bridged Networks Amendment 32: Virtual Station Interface (VSI) Discovery
and Configuration Protocol (VDP) Extension to Support Network Virtualization Overlays
Over Layer 3 (NVO3)

- 802.1Qcc-802.1Qcc-2018 - IEEE Standard for Local and Metropolitan Area Networks--
  Bridges and Bridged Networks -- Amendment 31: Stream Reservation Protocol (SRP)
  Enhancements and Performance Improvements
- 802.1Qcp-2018 - IEEE Standard for Local and metropolitan area networks--Bridges and
  Bridged Networks--Amendment 30: YANG Data Model
- 802.1X-2020 - IEEE Standard for Local and Metropolitan Area Networks--Port-Based
  Network Access Control

### 5.3 IEEE 802.3: Ethernet

- 802.3-2018 - IEEE Standard for Ethernet
- 802.3cp-802.3cp-2021 - IEEE Standard for Ethernet -- Amendment 14: Bidirectional 10
  Gb/s, 25 Gb/s, and 50 Gb/s Optical Access PHYs
- 802.3cv-802.3cv-2021 - IEEE Standard for Ethernet Amendment 12: Maintenance #15:
  Power over Ethernet
- 802.3cu-2021 - IEEE Standard for Ethernet - Amendment 11: Physical Layers and
  Management Parameters for 100 Gb/s and 400 Gb/s Operation over Single-Mode Fiber at
  100 Gb/s per Wavelength
- 802.3cr-2021 - IEEE Standard for Ethernet Amendment 10: Maintenance #14: Isolation
- 802.3ch-2020 - IEEE Standard for Ethernet--Amendment 8: Physical Layer
  Specifications and Management Parameters for 2.5 Gb/s, 5 Gb/s, and 10 Gb/s
  Automotive Electrical Ethernet
- 802.3ca-2020 - IEEE Standard for Ethernet Amendment 9: Physical Layer Specifications
  and Management Parameters for 100 Gb/s and 50 Gb/s Passive Optical Networks
- 802.3cq-2020 - IEEE Standard for Ethernet Amendment 6: Maintenance #13: Power over
  Ethernet over 2 pairs
- 802.3cq-802.3cq-2020 - IEEE Standard for Ethernet Amendment 6: Maintenance #13:
  Power over Ethernet over 2 pairs
- 802.3cg-802.3cg-2019 - IEEE Standard for Ethernet - Amendment 5: Physical Layer
  Specifications and Management Parameters for 10 Mb/s Operation and Associated Power
  Delivery over a Single Balanced Pair of Conductors
- 802.3cm-2020 - IEEE Standard for Ethernet -- Amendment 7: Physical Layer and
  Management Parameters for 400 Gb/s over Multimode Fiber
- 802.3cn-2019 - IEEE Standard for Ethernet - Amendment 4: Physical Layers and
  Management Parameters for 50Gb/s, 200Gb/s, and 400Gb/s Operation over Single-Mode
  Fiber
- 802.3cd-2018 - IEEE Standard for Ethernet - Amendment 3: Media Access Control
  Parameters for 50 Gb/s and Physical Layers and Management Parameters for 50 Gb/s,
  100 Gb/s, and 200 Gb/s Operation
- 802.3bt-802.3bt-2018 - IEEE Standard for Ethernet Amendment 2: Physical Layer and
  Management Parameters for Power over Ethernet over 4 pairs
5.4 IEEE 802.11: Wireless LAN

- 802.11-2020 - IEEE Standard for Information Technology--Telecommunications and Information Exchange between Systems - Local and Metropolitan Area Networks--Specific Requirements - Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications
- 802.11ax-2021 - IEEE Standard for Information Technology--Telecommunications and Information Exchange between Systems Local and Metropolitan Area Networks--Specific Requirements Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications Amendment 1: Enhancements for High-Efficiency WLAN
- 802.11ay-2021 - IEEE Standard for Information Technology--Telecommunications and Information Exchange between Systems Local and Metropolitan Area Networks--Specific Requirements Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications Amendment 2: Enhanced Throughput for Operation in License-exempt Bands above 45 GHz
- 802.11ba-2021 - IEEE Standard for Information Technology--Telecommunications and Information Exchange between Systems Local and Metropolitan Area Networks--Specific Requirements Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications Amendment 3: Wake-Up Radio Operation

5.5 IEEE 802.15: Wireless Specialty Networks

- 802.15.3-2016 - IEEE Standard for High Data Rate Wireless Multi-Media Networks
- 802.15.3f-2017 - IEEE Standard for High Data Rate Wireless Multi-Media Networks Amendment 3: Extending the Physical Layer (PHY) Specification for Millimeter Wave to Operate from 57.0 GHz to 71 GHz
- 802.15.3d-2017 - IEEE Standard for High Data Rate Wireless Multi-Media Networks--Amendment 2: 100 Gb/s Wireless Switched Point-to-Point Physical Layer
- 802.15.3e-2017 - IEEE Standard for High Data Rate Wireless Multi-Media Networks--Amendment 1: High-Rate Close Proximity Point-to-Point Communications
- 802.15.4-2020 - IEEE Standard for Low-Rate Wireless Networks
• 802.15.4y-802.15.4y-2021 - IEEE Standard for Low-Rate Wireless Networks
  Amendment 3: Advanced Encryption Standard (AES)-256 Encryption and Security
  Extensions
• 802.15.4w-802.15.4w-2020 - IEEE Standard for Low-Rate Wireless Networks--
  Amendment 2: Low Power Wide Area Network (LPWAN) Extension to the Low-Energy
  Critical Infrastructure Monitoring (LECIM) Physical Layer (PHY)
• 802.15.4z-2020 - IEEE Standard for Low-Rate Wireless Networks--Amendment 1:
  Enhanced Ultra Wideband (UWB) Physical Layers (PHYs) and Associated Ranging
  Techniques
• 802.15.6-802.15.6-2012 - IEEE Standard for Local and metropolitan area networks - Part
  15.6: Wireless Body Area Networks
• 802.15.7-2018 - IEEE Standard for Local and metropolitan area networks--Part 15.7:
  Short-Range Optical Wireless Communications
• 802.15.8-2017 - IEEE Standard for Wireless Medium Access Control (MAC) and
  Physical Layer (PHY) Specifications for Peer Aware Communications (PAC)
• 802.15.9-2021 - IEEE Standard for Transport of Key Management Protocol (KMP)
  Datagrams
• 802.15.10-802.15.10-2017 - IEEE Recommended Practice for Routing Packets in IEEE
  802.15.4 Dynamically Changing Wireless Networks
• 802.15.10a-802.15.10a-2019 - IEEE Recommended Practice for Routing Packets in IEEE
  802.15.4(TM) Dynamically Changing Wireless Networks - Amendment 1: Fully Defined
  Use of Addressing and Route Information Currently in IEEE Std 802.15.10

5.6 IEEE 802.16: Broadband Wireless MANs
• 802.16-2017 - IEEE Standard for Air Interface for Broadband Wireless Access Systems

5.7 IEEE 802.19: Wireless Coexistence
• 802.19.1-2018 - IEEE Standard for Information technology--Telecommunications and
  information exchange between systems--Local and metropolitan area networks--Specific
  requirements--Part 19: Wireless Network Coexistence Methods
• 802.19.3-2021 - IEEE Recommended Practice for Local and Metropolitan Area
  Networks--Part 19: Coexistence Methods for IEEE 802.11 and IEEE 802.15.4 Based
  Systems Operating in the Sub-1 GHz Frequency Bands

5.8 IEEE 802.21: Media Independent Handover Services
• 802.21-802.21-2017 - IEEE Standard for Local and metropolitan area networks--Part 21:
  Media Independent Services Framework
5.9 IEEE 802.22: Wireless Regional Area Networks

TV White Space has not been widely adopted in North America because most of the “white space” spectrum has been auctioned off for commercial cellular, leaving broadcast television packed into the remaining channels. The use of CBRS has been adopted for small regional networks, despite the downsides of much shorter range due to the higher frequency band.

6 Common network model for vertical application networks

A common foundation of the network architecture for a variety of vertical applications is provided by the IEEE Std 802.1CF-2019 IEEE Recommended Practice for Network Reference Model and Functional Description of IEEE 802 Access Network.

All communication networks providing the means to connect various communication endpoints (terminals) to the same or different information servers over a shared infrastructure follow the same architectural principles. IEEE 802 technologies well support the realization of an access network, that establishes the shared infrastructure allowing to manage the connections of a wide variety of terminals through wired or wireless interfaces to their communication peers, either through bridging in the local area, or through routing by an access router in more widespread networks.

6.1 Network Reference Model

Figure 1 below shows the mapping of the IEEE 802 Network Reference Model (NRM) to usual communication network topologies. Core of the NRM is the Access Network that connects terminally either directly through bridging or forwards traffic to the access router when the
communication peer is behind the same Layer 2 domain. Various control entities support the access network to provide secured and managed connectivity.

NMS denotes the network management system that provides the functions to configure and to monitor the correct operation of the access network infrastructure. The subscription service is the control entity that deals with the communication demand of the individual terminals. It provides authentication to restrict the usage of the access network to only known terminals and provides to the access network the configuration parameters that each of the terminal expects for proper operation.

Subscription Service is a general term that can mean any function from a traditional operator subscription service to a private network’s authentication and device policy control function.

Figure 2 below further details the network reference model through exposing the internal structure of the access network as well as the terminal and access router, and through the definition of reference points labeled R1 to R12 to denote control and user data interfaces of the access network. Solid lines indicate the path of the user data, while dotted lines indicate the flow of control information. The figure also shows an additional control entity called Coordination and Information Service, which is only needed when multiple access networks dynamically share the same communication resources, like in the case of dynamic spectrum management or dynamic resource sharing of virtual and virtualized access networks.
The IEEE 802 NRM is a conceptual model allowing many different implementations to leverage the same foundation and network functions, but it is not intended as an exact blueprint for the installation of a real network. Vertical applications have very specific networking requirements. To accommodate the variety of the requirements, the IEEE 802.1CF provides guidance and a common structure to build powerful networks out of the universal IEEE 802 technology building blocks.

The applicability and flexibility of the approach are demonstrated in IEEE Std 802.1CF through the mapping of the NRM to a number of deployment scenarios from a simple WLAN router, home networks, simple and more complex enterprise networks, industrial networks, public WLAN hotspots to virtualized WLAN access networks for in-building IoT services and networks for fog computing.

6.2 Generic IEEE 802 access network functional behavior

In addition to a common network reference model introduced above, the specification also provides generic functional description of the operation of an access network built through IEEE 802 technologies. Figure 3 below shows the functional phases of an access network during a session of an IEEE 802 terminal. The session begins with the terminal searching for potential access to a network and ends with either terminal or network tearing down the connectivity.
There are many network functions invoked between the beginning and the end of a session, and the figure 3 above shows a typical example mainly aligned to the IEEE 802.11 air interface. The functional description provides a comprehensive reference of the management and control information conveyed over the reference points between the access network and external control and management entities. Such reference is not only helpful for educational purposes but also fosters commonalities in the design of the control gear of IEEE 802 access network and provides a development base towards virtualization of IEEE 802 access networks.

6.3 Network virtualization, instantiation, and slicing

While well-known models like VLANs in IEEE 802 or the network slicing solution of 3GPP provide several isolated user data planes in a common infrastructure, which can be either assigned to different services or to different tenants of the network, the network functional modeling provides the prerequisites for setting up multiple instances not only for the user data path, but also for all the control associated with a user data path. Separating not only the data paths of multiple tenants, but also all the control associated with a data path allows to address one of the main prerequisites of deployment of vertical application networks, the need for independent operational domains for each of the verticals. Virtualized IEEE 802 access networks behave exactly the same way as dedicated access networks but have the cost and scalability benefits of making use of a common infrastructure. It is the same approach that was taken through Virtual Machines (VMs) leading to the establishment of cloud computing. Figure 4 below sketches the concept of virtualization of IEEE 802 access network. Three instances are shown based on a common infrastructure, each with its own control entities and
interfaces towards terminals and application servers reachable through the access router. As infrastructure resources can be dynamically shared among the virtualized networks, the CIS acts as control entity managing the dynamic assignment of infrastructure resources.

The virtualized access network example shown above is directing into potential network evolution beyond the current understanding of network slicing. However, the IEEE 802.1CF specification already provides the model and concepts of virtualized access networks, that can be fully build based on existing IEEE 802 protocol specifications. It is shown that realization of such powerful networking concepts with IEEE 802 technologies is a matter of implementation without the need for lengthy standardization activities. Just, let’s do it.

![Multiple instances of virtualized IEEE 802 access network](image)

*Figure 4: Multiple instances of virtualized IEEE 802 access network*
7 Higher layer functions and service design in vertical application networks

IEEE 802 provides a high variety of wired and wireless solutions for the Physical and Link layer functions of communication links to serve a very wide range of requirements of applications. Each of the applications can choose out of the common IEEE 802 communication toolbox the features that fit best its particular needs without compromises or exaggerated complexities due to a common higher layer architecture.

Application specific protocol stacks for network layer, transport layer, and application layer functions have been mostly replaced through IP protocols in the past decades to leverage the huge benefits of the common IP protocol regarding flexibility, performance, availability, and cost. IEEE 802 technologies played a huge role in the transformation to IP protocols as the protocols and technologies provided excellent support for the transport of IP packets and they were able to cope with the growth of IP traffic through steady enhancements.

Therefore, usually the **Generic IP** protocol stack is used for realizing vertical applications, leveraging IPv4/IPv6 in the Network layer, TCP or UDP in the Transport layer, and well-known IP protocols like HTTP, CoAP, or MQTT in the Application layer.

However, the IEEE 802 technologies allow for more specific network solutions when special requirements or conditions arise. Legacy networking protocol stacks can be operated for transition and interoperability aside of IP protocol solutions on the same communication infrastructure. The figure below illustrates for a few examples the approaches to realize vertical application networks on top of IEEE 802 technologies.

![Figure 5: Examples of vertical applications based on IEEE 802 networking](image)

Vertical application networks often not only deploy the IP based protocol suite but leverage more specialized transport solutions.
The Smart Energy Profile 2 (SEP 2) standard was initially specified by the ZigBee Alliance in conjunction with the HomePlug Alliance. It provides a RESTful messaging protocol for information and control for energy management in Home Area Networks for both wired and wireless networks. It can be applied on transport based on IETF IP protocols or other specialized transport protocols for particular link technologies like IEEE 802.15.4.

Matter is a smart-home connectivity standard that originated from the former Connected Home over IP (CHIP) project. It aims to provide interoperability among smart home devices and IoT platforms of different vendors and providers. Matter provides a multi-layer application protocol suite that is provided as open source for easy adoption. In addition to plain IP based connectivity over any kind of link technology it also supports Thread based connectivity over IEEE 802.15.4.

WAVE (Wireless Access in Vehicular Environments) is specified through IEEE 1609 leveraging IEEE 802.11 as wireless link technology. Various optimizations in the upper part of the Data Link layer and above were applied to cope with the particularities of a rapidly changing wireless environment. The IEEE 1609 series of specifications describes the architecture and services necessary for devices to communicate in a mobile vehicular environment. It follows the open system interconnect model and provides support for the Internet Protocol and its transport protocols. In addition, securing WAVE management messages and application messages is addressed as well as administrative functions necessary to support the core security functions.

8 The building block/stone heap and the castle – why IEEE 802 is somewhat different.

### 8.3 Administration

<table>
<thead>
<tr>
<th>Approach</th>
<th>IEEE 802</th>
<th>Others e.g. 3GPP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tools</td>
<td>Self-configuration, often distributed</td>
<td>Centrally controlled</td>
</tr>
<tr>
<td>Objectives</td>
<td>Use of simple security means</td>
<td>Complex security architecture</td>
</tr>
<tr>
<td>Applicability</td>
<td>Flat-fee services</td>
<td>SLAs and contracts</td>
</tr>
<tr>
<td>Standardization</td>
<td>More choices for customization and sophisticated use cases</td>
<td>Better suited to standard deployments</td>
</tr>
<tr>
<td>Interoperability</td>
<td>Limited to L1 &amp; L2; higher layers adopted from IETF</td>
<td>Complete suite of specifications partly leveraging IETF protocols</td>
</tr>
<tr>
<td>Execution</td>
<td>Basic tools provided, but finally relying on peer-to-peer agreements</td>
<td>Fully specified</td>
</tr>
<tr>
<td></td>
<td>Very scalable depends on operational needs</td>
<td>Only full scope according to specifications</td>
</tr>
</tbody>
</table>
### 8.4 Operation

<table>
<thead>
<tr>
<th>Approach</th>
<th>Usually over-provisioning used to avoid operational complexity and expenses</th>
<th>Dynamic re-adjustments of network resources to optimize operational cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tools</td>
<td>Simple means for verification of proper operation</td>
<td>Comprehensive monitoring</td>
</tr>
<tr>
<td>Objectives</td>
<td>Simplicity and automation</td>
<td>Full control and deep insights</td>
</tr>
<tr>
<td>Applicability</td>
<td>Keep bits flowing</td>
<td>Generate value</td>
</tr>
<tr>
<td>Standardization</td>
<td>Comprehensive standards for automation</td>
<td>Adjustable interfaces for operational excellence</td>
</tr>
<tr>
<td>Interoperability</td>
<td>Plug and play</td>
<td>Plug and configure</td>
</tr>
<tr>
<td>Execution</td>
<td>Switch it on and let it run</td>
<td>Operations center</td>
</tr>
</tbody>
</table>

### 8.5 Maintenance

<table>
<thead>
<tr>
<th>Approach</th>
<th>Highly modular to allow for gradual replacements and enhancements</th>
<th>Introduce a next generation end-to-end network for the next level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tools</td>
<td>Incremental enhancements</td>
<td>Complete replacements</td>
</tr>
<tr>
<td>Objectives</td>
<td>Foster and grow</td>
<td>Revolutionize the network</td>
</tr>
<tr>
<td>Applicability</td>
<td>Incremental adjustment of network capabilities</td>
<td>Harmonized infrastructure renewal</td>
</tr>
<tr>
<td>Standardization</td>
<td>Individual standards enhancements</td>
<td>Generational suites of standards</td>
</tr>
<tr>
<td>Interoperability</td>
<td>Forward and backward compatibility</td>
<td>Generational interworking</td>
</tr>
<tr>
<td>Execution</td>
<td>One piece at a time</td>
<td>Regular swap of complete infrastructure</td>
</tr>
</tbody>
</table>

### 8.6 Troubleshooting

<table>
<thead>
<tr>
<th>Approach</th>
<th>It depends</th>
<th>Count and measure everything</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tools</td>
<td>Simple tools for detection and localization</td>
<td>Comprehensive network management suite</td>
</tr>
<tr>
<td>Objectives</td>
<td>Base functions for proprietary</td>
<td>Ensure detection of any</td>
</tr>
<tr>
<td></td>
<td>IEEE 802</td>
<td>Others e.g. 3GPP</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------------------------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>solutions and common sense</td>
<td>malfunction and quick recovery</td>
</tr>
<tr>
<td>Applicability</td>
<td>Economic solutions adjusted to the</td>
<td>Guaranteed availability of highly complex infrastructures</td>
</tr>
<tr>
<td></td>
<td>needs of the use cases</td>
<td></td>
</tr>
<tr>
<td>Standardization</td>
<td>Definition of managed attributes</td>
<td>Standardized attributes, architecture, and procedures</td>
</tr>
<tr>
<td>Interoperability</td>
<td>Enable basic commonality</td>
<td>Interoperable higher layer network management</td>
</tr>
<tr>
<td>Execution</td>
<td>Low barrier to entry for vertical</td>
<td>Unique skill-sets and workforce</td>
</tr>
<tr>
<td></td>
<td>asset owners</td>
<td></td>
</tr>
</tbody>
</table>

### 9 Conclusion

The IEEE 802 family of standards provides a solid foundation of connectivity for any kind of vertical applications. The various IEEE 802 technologies are able to address the wide variety of requirements that result from deploying networks optimized for very specific purposes. Through modularity and interchangeability of functional building blocks, IEEE 802 networks are suited to easily scale from very small to very large infrastructures with modest to very demanding data transfer capacities fostering not only functional but also economic competition among different approaches. Nevertheless, the various solutions follow common architectures and a common network reference model to facilitate gradual improvements and to keep necessary learning curves for design, implementation, and operation relatively flat. Even when IEEE 802 standards are providing by far the primary transport technologies for IP based communication solutions, other network protocols, as often used for optimization or interoperability in vertical applications, are supported as well and can even run in parallel with IP on the same network infrastructure.
